REPORTS ON WILD-DUCK FOODS
OF NORTH DAKOTA LAKE REGION

A report upon a botanical survey of about 500 North Dakota lakes, made by the Bureau of Biological Survey to determine the wild-fowl food resources of that State, has just been issued by the United States Department of Agriculture. It lists the important duck-food plants found in North Dakota, presents the results of research on the tolerance of aquatic plants to concentrations of salts, describes the various plant associations found in the classes of lakes surveyed, and in a series of tables indicates the relative abundance of the most common duck-food plants of the various lakes. It includes an annotated list of plants collected by the survey in the vicinity of the lakes and sloughs.

Copies of the new bulletin, Wild-Duck Foods of North Dakota Lakes, (Technical Bulletin 221-T) may be obtained free as long as the supply lasts on request to the United States Department of Agriculture, and after that from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 15 cents a copy.
